

IDEATION PHASE

Customer Journey Map — Import Data Using Transform Maps (Spreadsheet)

Date	03 October 2026	Team ID	SWTID-2026-7959	Scenario	A ServiceNow administrator imports employee spreadsheet data, transforms it into a target table, validates the records, and reviews reports.		
JOURNEY STAGE	1. Discover Understand the task	2. Prepare Check spreadsheet	3. Import Load source data	4. Transform Map and transform	5. Validate Verify target records	6. Review Check reports	7. Improve Resolve issues
Steps	Open ServiceNow and locate the import workflow.	Prepare the spreadsheet with Employee ID, Name, Email, Department, and Location.	Load spreadsheet rows into Employee Import (u_employee_import).	Run the Transform Map to move values into Employee Test (u_employee_test).	Review imported employee records and compare values with the source spreadsheet.	Open Employees List, Employees by Department, and Employees by Location reports.	Correct mapping or data issues and repeat the import/validation when needed.
Interactions & touchpoints	ServiceNow navigation, import modules, project instructions, and admin interface.	Spreadsheet application, column headers, six sample employee records, and data checks.	Import Set table, upload/import interface, import run status, and staged rows.	Transform Map, five field mappings, coalesce setting, transform action, and target table.	Employee Test list, record forms, source spreadsheet, and field-by-field checks.	List and chart reports showing employee records, department distribution, and location distribution.	Transform history, error messages, field map configuration, and updated spreadsheet data.
Goals & motivations	Help me find the correct place to start the data import.	Help me ensure the spreadsheet is organized and complete.	Help me load multiple employee records without entering them one by one.	Help me place every source value in the correct target field and handle existing records safely.	Help me confirm that employee IDs, names, emails, departments, and locations are accurate.	Help me quickly understand and present the imported employee data.	Help me identify errors, avoid duplicate records, and make future imports more reliable.
Positive moments	A clear workflow gives the administrator a starting point.	Consistent headers make the spreadsheet easier to map.	Six sample records can be staged together, reducing manual entry.	Five configured field maps connect source and target fields.	A matching source and target record confirms the transform worked as expected.	Three reports make the imported data easier to review and summarize.	A repeatable process can reduce effort for later spreadsheet imports.
Negative moments	The administrator may be unsure which table or module to use.	Missing values, inconsistent headers, or invalid email values can reduce data quality.	Import errors or incorrect source columns can create incomplete staging records.	Incorrect field mapping or an unsuitable coalesce field may update or duplicate records unexpectedly.	Manual checking takes time and errors can be missed if only a few records are inspected.	Reports may be misleading if the imported data is incomplete or inconsistent.	Repeating the process without recording errors may cause the same issues again.
Areas of opportunity	Provide a short checklist for navigating to Import Sets and Transform Maps.	Validate required columns, email format, unique Employee ID values, and blank cells before upload.	Show import status and clearly identify rejected or incomplete rows.	Verify whether Employee ID should be the unique coalesce field; the supplied screenshot currently shows coalesce enabled on Employee Name.	Use a record-count check and compare sample values across source and target tables.	Add report filters or clear labels so the results are easier to interpret.	Maintain an import checklist and document common errors for the next run.

Project evidence: Employee Import (u_employee_import) is the staging table; Employee Test (u_employee_test) is the target table. The current setup includes five field mappings, six sample employee records (SB0001–SB0006), and three reports. **Configuration note:** The supplied screenshot shows coalesce enabled on Employee Name; verify the coalesce field if Employee ID is intended to be the unique identifier.
