

PROJECT DESIGN PHASE-II

Solution Requirements (Functional & Non-functional)

Date	03 October 2026	Team ID	SWTID-2026-7959
Project Name	Import Data Using Transform Maps (Spreadsheet)	Maximum Marks	4 Marks

Functional Requirements: Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Spreadsheet Import	The administrator can upload a spreadsheet containing Employee ID, Name, Email, Department, and Location into the Employee Import staging table (u_employee_import).
FR-2	Import Set Staging	The system stages each spreadsheet row as an import-set row and makes the imported data available for transformation.
FR-3	Field Mapping	The transform map supports five source-to-target mappings: Employee ID, Name, Email, Department, and Location to their corresponding Employee Test fields.
FR-4	Data Transformation	The administrator can run the Transform Map to transfer staged values into Employee Test (u_employee_test).
FR-5	Record Matching / Coalesce	The transform map supports coalesce-based matching to identify records to update instead of creating unintended duplicates. The configured coalesce field should be verified before production use.
FR-6	Record Validation	The administrator can review target records and compare employee field values with the source spreadsheet to identify missing or incorrect data.
FR-7	Employee List Report	The system provides an Employees List report to review employee records stored in Employee Test.
FR-8	Department Report	The system provides an Employees by Department report to summarize employee records by department.
FR-9	Location Report	The system provides an Employees by Location report to summarize employee records by location.
FR-10	Import Troubleshooting	The administrator can inspect import/transform results and correct source data or field mappings when issues are found.

NON-FUNCTIONAL REQUIREMENTS

Quality attributes for the spreadsheet import workflow

Non-functional Requirements: Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The import and transform workflow should be understandable to a ServiceNow administrator, with clearly named tables, fields, transform maps, and reports.
NFR-2	Security	Access to import tables, transform maps, and employee data should be limited to authorized users with appropriate ServiceNow roles.
NFR-3	Reliability	Repeated imports should produce consistent results when the spreadsheet data and transform-map configuration remain unchanged.
NFR-4	Performance	The workflow should process the six sample employee records without unnecessary manual entry; larger imports should be tested against the instance's practical limits.
NFR-5	Availability	The import workflow and reports should be available whenever the ServiceNow instance and the user's access are available.
NFR-6	Scalability	The table and transform-map configuration should support adding more employee rows and future records without redesigning the basic workflow.
NFR-7	Data Integrity	Employee ID, Name, Email, Department, and Location values should be preserved accurately from the spreadsheet to the target table.
NFR-8	Maintainability	Field mappings, coalesce settings, and report definitions should be easy for an authorized administrator to review and update.
NFR-9	Auditability	Import and transform outcomes should be reviewable so that the administrator can investigate unexpected results and correct issues.

Project context: The source spreadsheet contains six sample employee records (SB0001–SB0006). Data is staged in Employee Import (u_employee_import), transformed into Employee Test (u_employee_test), and reviewed using Employees List, Employees by Department, and Employees by Location reports.

Configuration note: The provided screenshot shows coalesce enabled on Employee Name. Verify the coalesce field if Employee ID is intended to be the unique identifier.
