

PROJECT DESIGN PHASE

Proposed Solution Template

Date	03 October 2026	Maximum Marks	2 Marks
Team ID	SWTID-2026-7959	Project Name	Import Data Using Transform Maps (Spreadsheet)

Proposed Solution Template: The following solution is based on the supplied ServiceNow project evidence. Features already shown in the project are distinguished from recommended future improvements.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Employee information maintained in spreadsheets must be transferred into ServiceNow accurately and consistently. Manual entry or copy/paste can create delays, typing mistakes, inconsistent field values, and duplicate records. The project addresses the need to import employee data and review the resulting records through a repeatable workflow.
2	Idea / Solution description	Use ServiceNow Import Sets and a Transform Map to load spreadsheet data into a staging table and then map it to the target table. The documented workflow uses Employee Import (u_employee_import) as the staging table and Employee Test (u_employee_test) as the target table. Five fields are mapped: Employee ID, Name, Email, Department, and Location. The six sample records are SB0001–SB0006. Users can review results through Employees List, Employees by Department, and Employees by Location reports.
3	Novelty / Uniqueness	The solution brings spreadsheet ingestion, explicit field mapping, duplicate-handling configuration, and report-based verification into one ServiceNow workflow. Its practical value is the structured, repeatable process rather than a claim of a new algorithm. A recommended improvement is to validate whether Employee ID should be the coalesce field, because it is generally more suitable as a unique employee identifier than a name. This change should be tested before being treated as implemented.
4	Social Impact / Customer Satisfaction	The workflow can reduce repetitive data entry and make employee records easier to review. It may improve consistency for administrators and staff who depend on accurate employee lists and department/location summaries. Suggested success measures include import completion rate, number of rejected or mismatched rows, duplicate-record count, time spent per import, and user satisfaction. These benefits are expected outcomes and have not been validated through documented user research.
5	Business Model (Revenue Model)	This project is best positioned as an internal productivity solution, not a standalone revenue-generating product. Potential value can be measured as time saved during recurring imports, reduced correction effort, and improved reporting access. If adapted for client delivery, a service model could include setup and configuration, data-mapping support, user training, and ongoing maintenance. Any commercial use would depend on licensing, customer requirements, and deployment scope.
6	Scalability of the Solution	The same pattern can be extended to larger spreadsheets and additional employee fields, departments, or reporting needs, subject to instance limits and testing. Proposed improvements include validating required fields, checking email formats, recording import errors, testing duplicate handling, documenting rollback/recovery steps, and measuring performance with larger datasets. Scalability has not been benchmarked beyond the six sample records shown in the project evidence.

Project evidence and assumptions: Current configuration details are based on the supplied screenshots showing the Import Set, Transform Map, five field mappings, Employee Test table, sample records, and three reports. Recommendations are explicitly described as proposed; performance, customer feedback, and commercial outcomes have not been measured.
