

PROJECT DESIGN PHASE

SOLUTION ARCHITECTURE

Date	03 October 2026	Team ID	SWTID-2026-7959
Project Name	Import Data Using Transform Maps (Spreadsheet)	Maximum Marks	4 Marks

Solution Architecture

The architecture describes how employee data moves from a spreadsheet into ServiceNow, is staged in an Import Set table, transformed through configured field mappings, stored in the target table, and reviewed through reports.

ServiceNow Spreadsheet Import — Solution Architecture

Review and validation are recommended process steps; automated validation configuration is not confirmed.

Architecture components and responsibilities

Component	Role in the solution	Project evidence / notes
Spreadsheet source	Provides employee rows for import.	Sample sheet contains Employee ID, Name, Email, Department, and Location.
Import Set / staging	Holds imported rows before transformation.	Employee Import — u_employee_import .
Transform Map	Maps source columns to target fields and processes imported rows.	Sample Spreadsheet Import; five mappings are shown in project screenshots.
Coalesce configuration	Controls matching against existing records to update/match instead of always inserting.	Screenshot shows coalesce enabled for Employee Name. Confirm the most suitable unique key before production use.
Target table	Stores the transformed employee records.	Employee Test — u_employee_test .
Reports	Supports review of imported employee data.	Employees List; Employees by Department; Employees by Location.

Component	Role in the solution	Project evidence / notes
Sample dataset	Used to demonstrate the import and reporting workflow.	Six sample records: SB0001–SB0006.
Access and security	Ensures only authorized users can import or view employee data.	Recommended: review ServiceNow roles and ACLs. Exact security configuration was not provided.
Validation and error handling	Checks that target values match source data and flags mismatches for correction.	Recommended manual verification; automated validation rules are not confirmed.

SOLUTION ARCHITECTURE — WORKFLOW & REQUIREMENTS

The following sequence summarizes the data flow and key design considerations.

Step	Description
1. Prepare source	Create or update the spreadsheet with the five expected columns. Check column headings and values.
2. Load import set	Import spreadsheet data into Employee Import (u_employee_import).
3. Transform rows	Run the Sample Spreadsheet Import Transform Map to map source values to the target fields.
4. Match records	Apply the configured coalesce field. Verify that the selected field reliably identifies an employee.
5. Store target data	Transformed records are written to Employee Test (u_employee_test).
6. Review results	Inspect SB0001–SB0006 and compare target values with the source spreadsheet.
7. View reports	Use Employees List, Employees by Department, and Employees by Location to review the result.

Design goals

- Reduce repeated manual data entry.
- Keep source-to-target mappings explicit.
- Support repeatable imports.
- Make imported records easier to inspect through reports.
- Identify data mismatches before relying on the results.

Proposed checks (not confirmed as implemented)

- Confirm Employee ID is the best coalesce key if it is unique and stable.
- Check required values and email formats before or after transformation.
- Review import/transform errors and reconcile record counts.
- Restrict access to employee data using appropriate ServiceNow roles and ACLs.

Reference

Project screenshots and supplied project details showing the Employee Import table, Sample Spreadsheet Import Transform Map, field mappings, Employee Test table, sample records, and report definitions. The uploaded Solution Architecture template provides the architecture section and example-diagram format.
